Thank you for taking the time to complete the Adult ADHD Self-Report Scale and for engaging so thoughtfully with the process of understanding your own mind. Recognizing patterns in your attention, energy, or organization takes courage and self-awareness, and whatever you’re feeling right now upon seeing these results—relief, validation, uncertainty, or even a mix of all three—is completely normal. Many adults go through much of their lives sensing that certain everyday tasks feel harder than they seem to be for others, without having language or context for why. Reaching this point of curiosity is a meaningful and positive step.

In practical terms, your results show that on Part A, 5 out of 6 core screening questions aligned with patterns commonly associated with ADHD symptoms in adults, well above the threshold of 4 typically used to flag this

as worth exploring further. Your Part B score of 9 out of 12 adds further supporting detail, painting a picture that is, statistically speaking, consistent with the experiences many adults with ADHD describe. It's important to underscore that this is a screening tool, not a diagnostic instrument. It cannot tell you definitively whether you have ADHD; rather, it's a well-validated indicator that your experiences deserve a closer, professional look.

In the meantime, there are gentle, empowering steps you can take. Consider keeping a simple daily log for a week or two, noting moments when focus, memory, or restlessness feel most challenging, since this can offer valuable insight for both you and any professional you consult. Experimenting with external structure, such as visual timers, task-breakdown apps, or written checklists, can also provide immediate relief for some of the friction you may be experiencing. Practicing self-compassion throughout this process matters just as much, since many of these patterns are neurological in nature rather than reflections of effort or character.

Ultimately, the most valuable next step is connecting with a qualified healthcare provider, such as a psychologist, psychiatrist, or your primary care physician, who can conduct a comprehensive evaluation. Should these results be confirmed, know that effective strategies, supports, and treatments exist, and many adults find that proper understanding brings not just clarity, but genuine relief and a renewed sense of possibility.

## Recommendations

We strongly recommend consulting a psychiatrist, psychologist or specialist in adult ADHD. A formal diagnosis opens access to evidence-based treatments (medication, CBT, coaching) that can significantly improve quality of life. Many adults with ADHD lead highly successful lives with the right support.

### Important Notice

This report is a screening tool only and does not constitute a medical or psychological diagnosis.

**This test does not replace a professional evaluation. For a reliable diagnosis, please consult a neuropsychologist, psychiatrist, or qualified healthcare professional.**
